

Understanding By Design (UbD)– Backwards Design Process
 (Modified from Grant Wiggins and Jay McTighe, 2002 for Self-Evaluation of RMAIS lessons)

Leadership in Science

Stage 1 – Desired Results	
<p>Content: Topic for Lesson</p> <ul style="list-style-type: none"> Leadership in Science 	
<p>Understanding (s)/goals Participants will understand that:</p> <ul style="list-style-type: none"> <i>Leadership is needed in different contexts in science.</i> <i>Leadership is a type of personal expression.</i> <i>There are many different types of leadership styles.</i> <i>Leadership style is flexible and depends on the match with the person (leader) and context.</i> 	<p>Essential Question(s):</p> <ul style="list-style-type: none"> How do personal values inform effective leadership styles? How does context inform effective leadership styles in science?
<p>Lesson objectives (outcomes): Participants will be able to demonstrate:</p> <ul style="list-style-type: none"> <i>KNOWLEDGE: Aspects of scientific careers that require leadership, different leadership styles</i> <i>SKILLS: Ability to articulate personal leadership style, ability to match effective leadership styles with different situations in science</i> 	
Stage 2 – Assessment Evidence	
<p>Performance Task(s):</p> <ul style="list-style-type: none"> Small group work to identify where leadership is applied in scientific careers. Individual work to develop personal leadership vision. Individual work to determine natural leadership style. Small group work to determine appropriate leadership styles for scientific careers. 	<p>Other Evidence:</p> <ul style="list-style-type: none"> Participant reflections on compare/contrast of application of leadership in science. Participant reflections on how different leadership styles benefit a scientific organization and its members. Participant reflections on leadership styles they would like to cultivate.
Stage 3 – Learning Plan	
<p>Learning Activities:</p> <ul style="list-style-type: none"> 1. Science and leadership activity <ul style="list-style-type: none"> Engage participants: In small groups, participants come up with 2-3 aspects of a scientist’s job that require leadership characteristics. Participants engage with each other: Groups create larger list by writing job aspects on board. Explore topic with participants: Present list of job aspects from Nature article and compare/contrast with list on board. 2. Develop personal leadership vision <ul style="list-style-type: none"> Engage participants: Participants write down a list of 10 personal values (e.g., creativity, decisiveness, honesty) Participants engage with each other: Participants discuss personal values in small groups in order to brainstorm additional potential personal values they might want to include. Refine personal leadership vision: Participants pare down their personal list to 2-3 core values 	

- 3. Leadership style is personal
 - Engage Participants: Participants compare their core values with defined leadership styles and determine their natural leadership style and/or mix of styles
- 4. Leadership style depends on context
 - Participants engage with each other: Participants work as a group to match scientific job aspects from activity 1 to leadership styles introduced in activity 3.
 - Explore topic with participants: Discuss 1) How leadership styles benefit a science organization and its members? and 2) Are there leadership styles participants would like to cultivate given their personal leadership vision and interest in science?
